

# SPOTTING WIND & HAIL DAMAGE

With the arrival of spring, you should be prepared for potential severe storms, which can bring strong winds, heavy rains, and even hail. Wind and hail damage can be difficult to detect immediately after a storm, so you should inspect your roof and exterior of your home for any visible damage. Below are several ways to spot wind and hail damage that may have occurred on your property.

- **Look for missing shingles from your roof.** Don't stand on the roof while looking, in case it isn't structurally sound.
- **Look for loose debris around your home.** Check for missing shingles, gutter parts, or even pieces of siding from the home.
- **Look for visible water infiltration.** Any visible water damage in the ceilings could be a result of the wind/hail storm.
- **Look for clogged or broken gutters.** Hail can stop the proper flow of the gutter, causing water damage to the home.
- **Look for visible damage to the exterior of the house.** Check for dings and dents in siding, chipping or discoloration to paint, or holes in stucco.

**If you experience wind or hail damage, call the nation's leading provider of disaster restoration, ServiceMaster DSI. From start to finish, we will be there every step of the way.**
